

ECR Excellence

Software for the system of electronic cash registers, where it is possible to use devices with their own registration program and a separate fiscal printer, while these are defined as follows:

- The own registration program is a program that controls the preparation of data on the sale of goods or the provision of services before they are registered in the fiscal printer through the communication module in a fiscal printer
- Fiscal printer is an electronic registration device equipped with operating memory, built-in registration program, fiscal memory, customer display device, clock, printer and communication module, which form one functional unit

Our company has developed an integrable software package with its own registration program that works with fiscal thermal printers. The functional unit is certified by the EVPÚ state testing laboratory in accordance with the wording of the law on the use of ERP. The central administration enables information on the status and service indicators of fiscal printers, the collection and archiving of operating data (so-called electronic journals) and ensures the possibility of remote device configuration.

The developed solution is mainly intended for business networks with a higher number of sales points, where emphasis is placed on the following features:

- Clear information about the status of devices (connected fiscal printers)
- Early warning and detection of error conditions requiring service intervention
- Automated archiving of data - electronic journals on a central archiving server
- Possibility of central configuration - possibility of changing non-fiscal parameters and settings
