# IAM EXCELLENCE

Information systems developed by our company for the needs of Identity Management manage user identities and access so that the right people and job positions in your organization (identities) have access to the tools they need to do their jobs.

Identity and access management systems allow users in an organization to manage employee applications without logging into each application as an application administrator. Identity and access management systems enable your organization to manage a range of identities, including people, software and hardware such as robotics and devices and peripherals. Organizations need IAM to provide online security and increase employee productivity.

Traditional IT security often has a single point of failure in the form of username and password. If a user's password—or worse, a password reset email address—is compromised, your organization becomes vulnerable to attack.

Identity Management Suite services narrow down points of failure and protect against them with tools to catch errors when they occur. Once you log into your central IAM portal, your employee no longer has to worry about whether they have the right password or the right level of access to perform their duties. Each employee gets access to a software suite of tools for their job, but their access can be managed as a group or role instead of individually, reducing the burden on your IT professionals.
