

Remote Fiscal Modules Management System

Law no. 289/2008 regarding the use of electronic cash registers (ERP) imposes an obligation for businesses to register all sales in the ERP. As an electronic cash register one can use a computer with own registration program and a separate fiscal printer. These are defined as follows

- Own registration program is a program managing the preparation of data regarding sales of goods or provisioning of services before they are registered through the communication module in the fiscal printer
- Fiscal printer is an electronic registration device equipped with an operating memory, built-in registration program, fiscal memory, display device for the customer, clock, printer and communication module which together make up one functional unit

Our company has developed an integrated solution with its own registration program and fiscal thermal printer TH230 / TH230 + FMSK which is certified by the national testing laboratory EVPU in accordance with the electronic cash registers usage act. Central management provides real time information on the status and service indicators of fiscal printers, data collection and archiving of operational data (i.e. electronic journals) and allows remotely configuring individual devices.

The developed solution is especially designed for business networks with higher number of points of sale, which require the following features

- Clear indicators about the current status of individual devices (connected fiscal printers)
- Early warning and detection of fault conditions requiring servicing
- Automated archiving of electronic journals on the central archive server (recorded by operation days)
- Central configuration (management of non-fiscal parameters and settings)
